Patients seeking an alternative to penicillamine for Wilson's disease management often consider Trientine under physician guidance. While penicillamine is commonly prescribed as first-line chelation therapy, some individuals experience side effects that require a different therapeutic option. Trientine functions by binding excess copper and promoting its safe elimination from the body, helping reduce toxic accumulation in organs. Physicians may recommend it for patients who cannot tolerate penicillamine or require long-term maintenance therapy. Careful monitoring ensures appropriate dosage and safety throughout treatment. In India, Triokris (Trientine) is facilitated by Ikris Pharma Network to support continuity of care.
